In order to offer an electronic camera having such a strength and a thickness as capable of shoving in a breast pocket of a dress shirt or in a hip pocket of jeans and such a lightness as make one no sense of discomfort when it is put in these places or a handbag, and yet having a zoom mechanism of high magnification, an electronic camera is made thin by defining an outer diameter of the lens to a thickness of the display unit disposed on the operation unit, a memory, a battery and a control circuit board, supporting a casing on a lens frame through which a guide shaft is pierced so as to move the lens back and forth, and disposing a cam for moving the zoom lens at the side of a lens system.
